# **ResNet9 numpy mnist**

# performance

测试集准确率99.55%

#### Loss curve

### **Dependency**

cupy & numpy

pip install cupy-cuda12x

to draw these figs,

torch, matplotlib are used

### **Implementation**

Convblock, Resblock, Maxpooling, Avgpooling, Dropout, softmax, relu, cross\_entropy\_loss, all these forward and its corresponding backward.

## **Experiments**

Mnist, 60000 for train, 10000 for test.

Hyperparameter:

Batchsize: 64, so every epoch has 938 iterations

learning rate: 1e-4

dropout rate: 0.9

epochs\_max: 200

#### Failure case

numpy failure case

6 4 9 8 4 1 3 4 8 9 2 4 9 0 3 1 5 2 9 0 4 8 2 5 2 8 5 4 9 0 3 8 9 7 1 7 4 1 7 5 8 9 1 6 8 8 9 7 5 9 4 4 1 9 4 2 5 6 3 1 7 6 6 4 7 9 8 6 3 9 4 9 5 3 5 9 7 0 6 2 7 8 4 7 9 5 2

The first row is the input images, second row is combination of wrong predictions, third row is combination of labels

### Try the code

After installing all dependencies(site-packages), run

python mnist\_maxpool\_weightdecay.py

Parameters, log files, backups will be saved at ../save/20241019, you can modify variable tag for different folders.

The pytorch version, run

cd torch\_version

python resnet9\_torch.py

And to show the results (just like this report), after training, run

python plot\_figs.py

#### Other statements

In our implementation of MaxPooling2D, a mask that records the position of max indices of forward process is used, then passed into backward process. It is possible that, a sub block has 2 values, they all equal to the max value, a conservative choise is to randomly choose one, but we make the mask of all these positions into 1——for simplification.

The dropout rate is an interesting parameter, we found even 99% droprate can achieve >99% accuracy, but more easy to collapse. And in our experiment, we tried 0.5, 0.6, 0.7, 0.8, 0.9, 0.95, 0.99 droprate, 0.9 can achieve the highest test accuracy (99.55%)
